What is “Easy Cutscenes”?

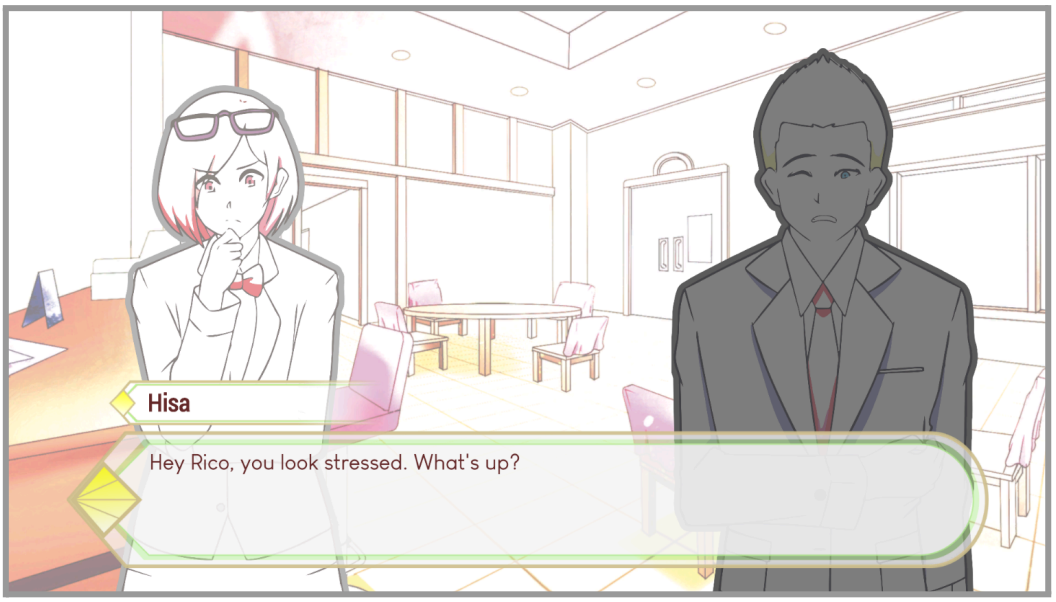
In a cutscene designed for dialogue or monologue, each line of text can be paired with a different character sprite to show emotions like happiness, anger, or surprise. As the character speaks, switching their sprite to match their feelings adds more depth and personality, making the conversation feel more natural and expressive. This simple approach helps players connect with the characters, making the story more immersive and engaging without needing complex animations.

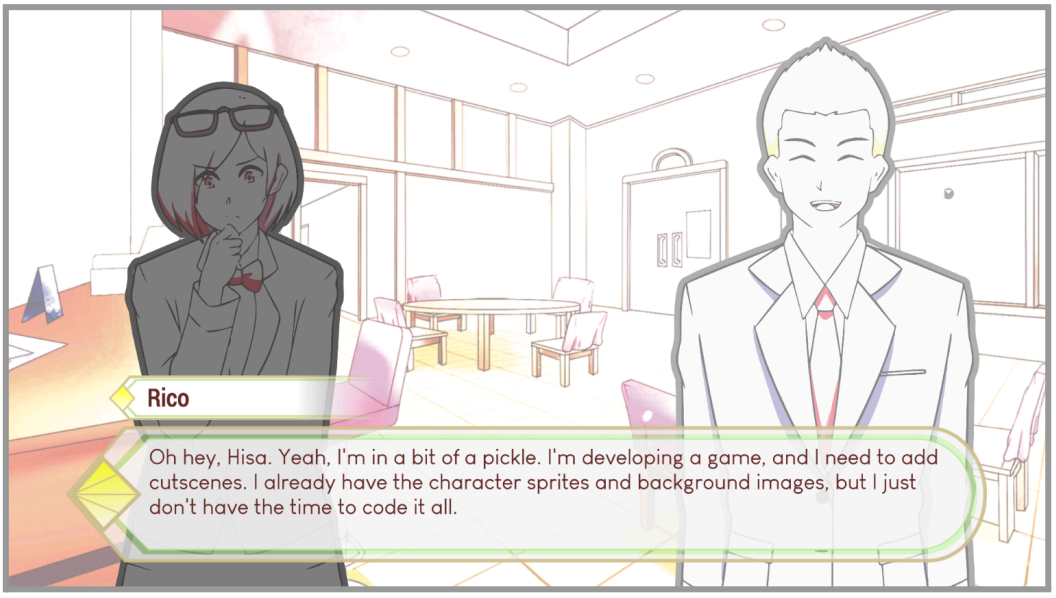
How can we build it?

You can build your own Cutscenes with this tool.

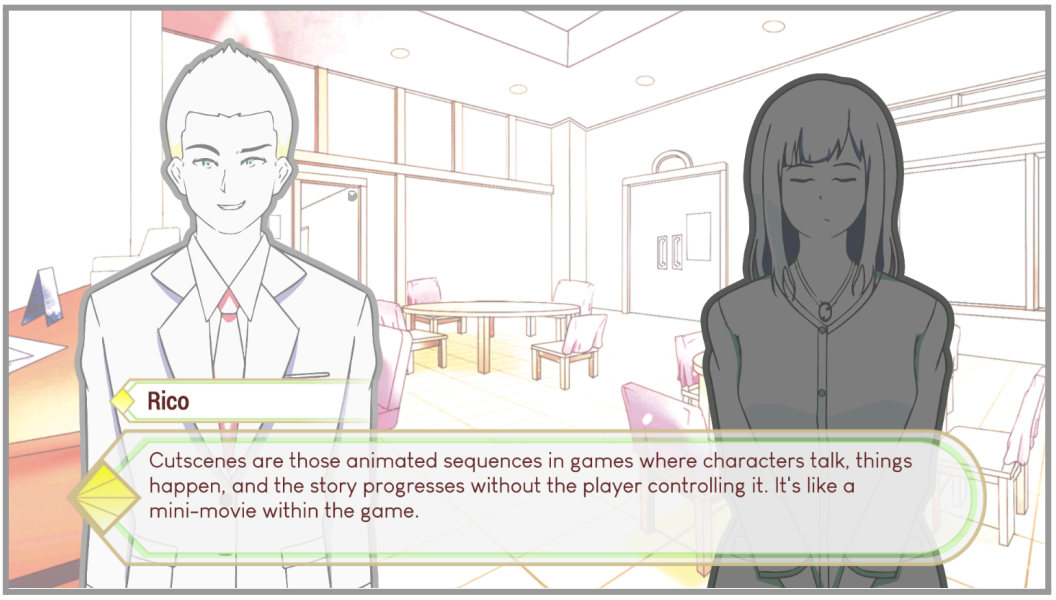
Step by step to using Easy Cutscenes

1. Download and Import **Easy Cutscenes** from Unity Assets Store.
2. Follow the step by step that is explained in the story below.





Mira
"Cutscenes? What's that?



Rico
Cutscenes are those animated sequences in games where characters talk, things happen, and the story progresses without the player controlling it. It's like a mini-movie within the game.

Mira
Oh, I see. That sounds complicated!

Hisa
Actually, it's not that complicated if you have the right tools. Have you heard of Easy Cutscene for Unity?
Rico
Easy Cutscene? What's that?
Hisa
Easy Cutscene is a Unity plugin that lets you create 2D sprite-based cutscenes quickly and easily without any coding. Let me show you how it works.

Narrator
Let's see the steps to create a cutscene with Easy Cutscene.

Hisa
First, prepare your image assets. This includes character sprites, props sprites, background images, and UI dialog panels.

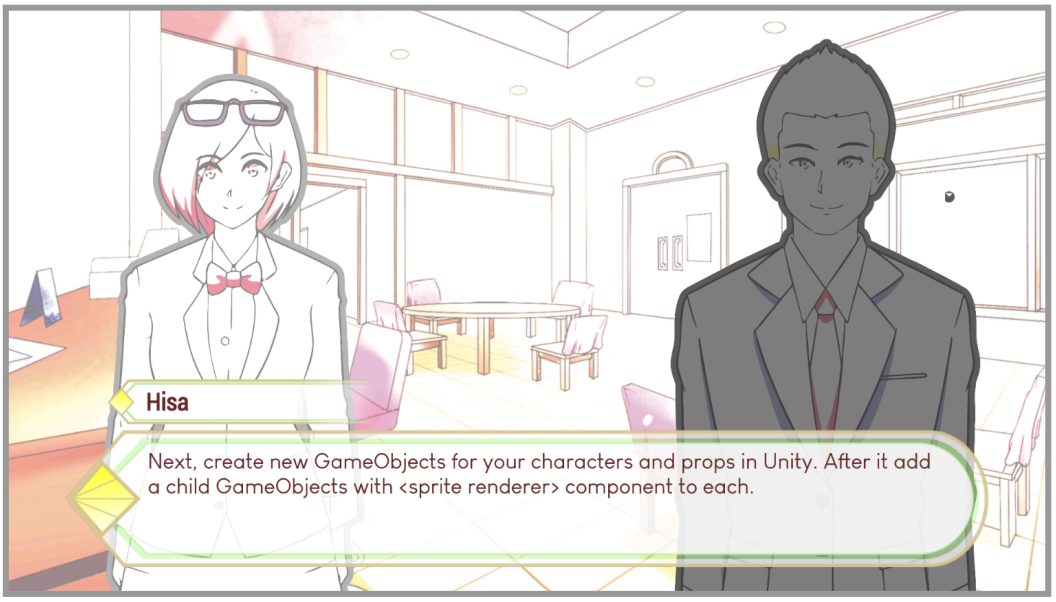
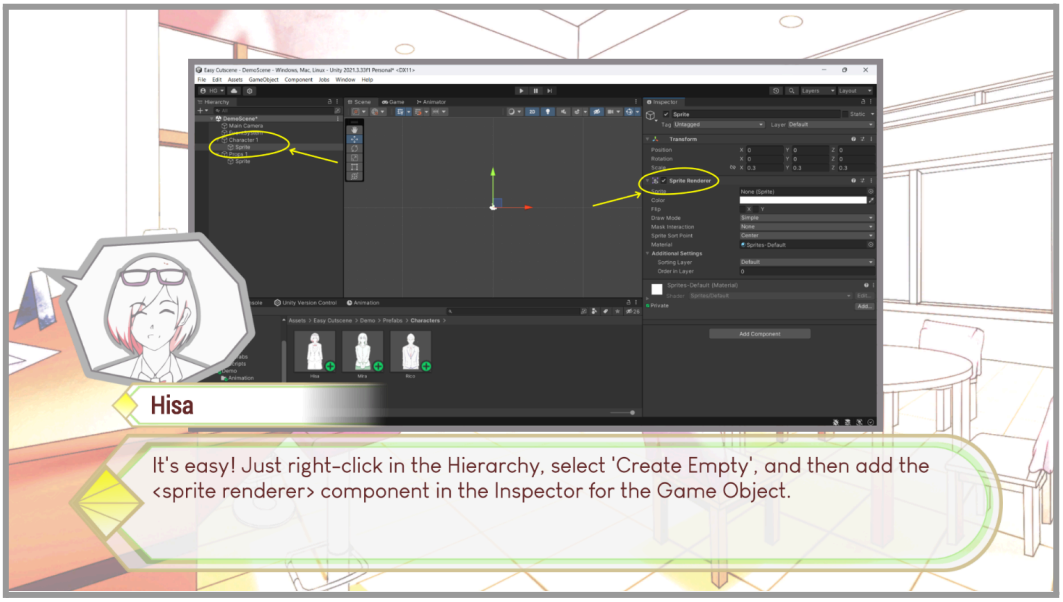
Rico
Got it. I have all my images ready.

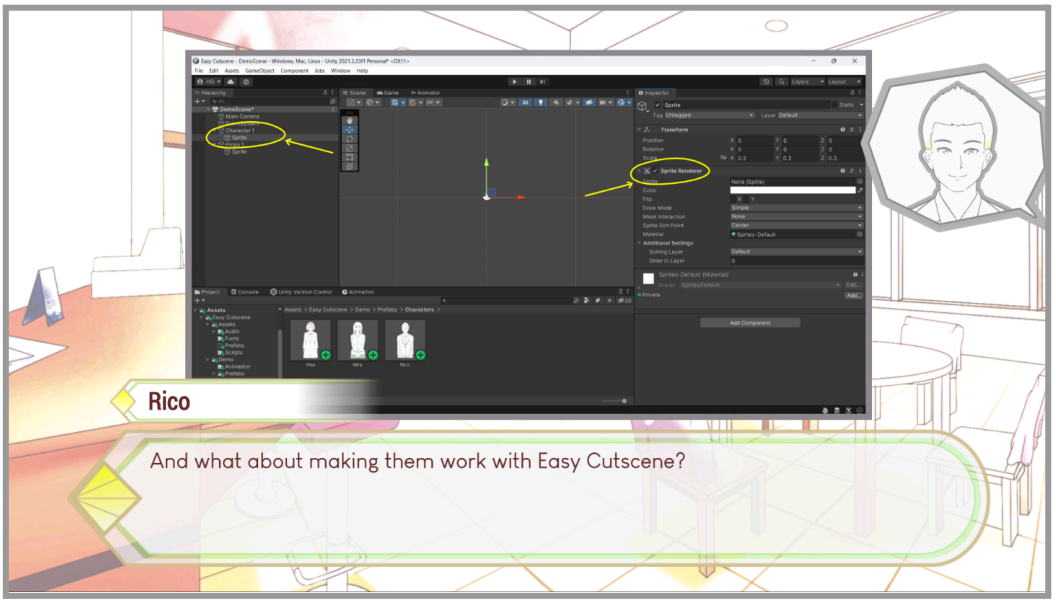


Hisa
Next, create new GameObjects for your characters and props in Unity. After it add a child GameObjects with <sprite renderer> component to each.

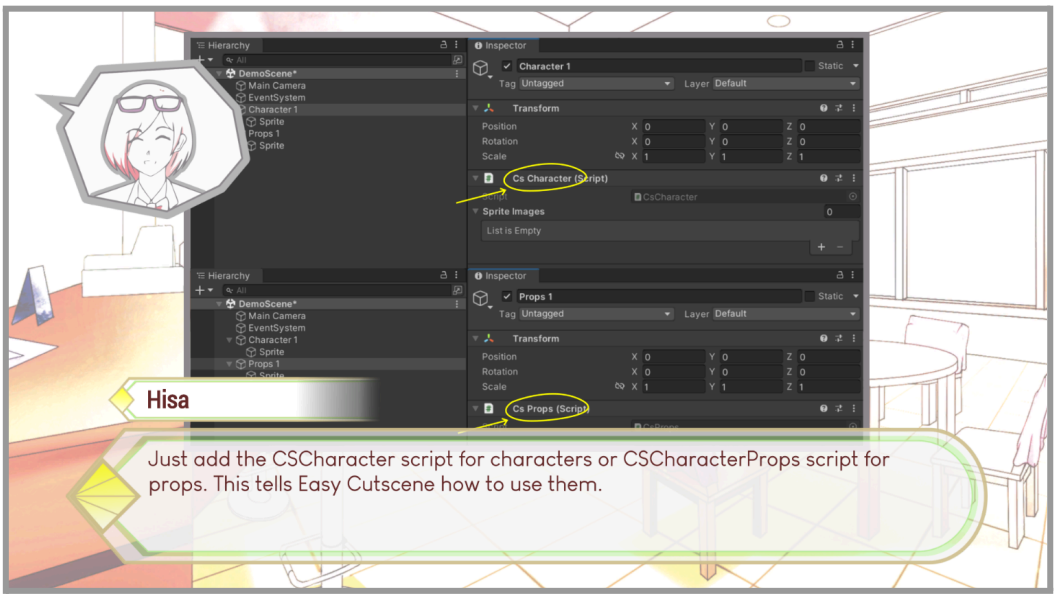
Mira
How do you do that?



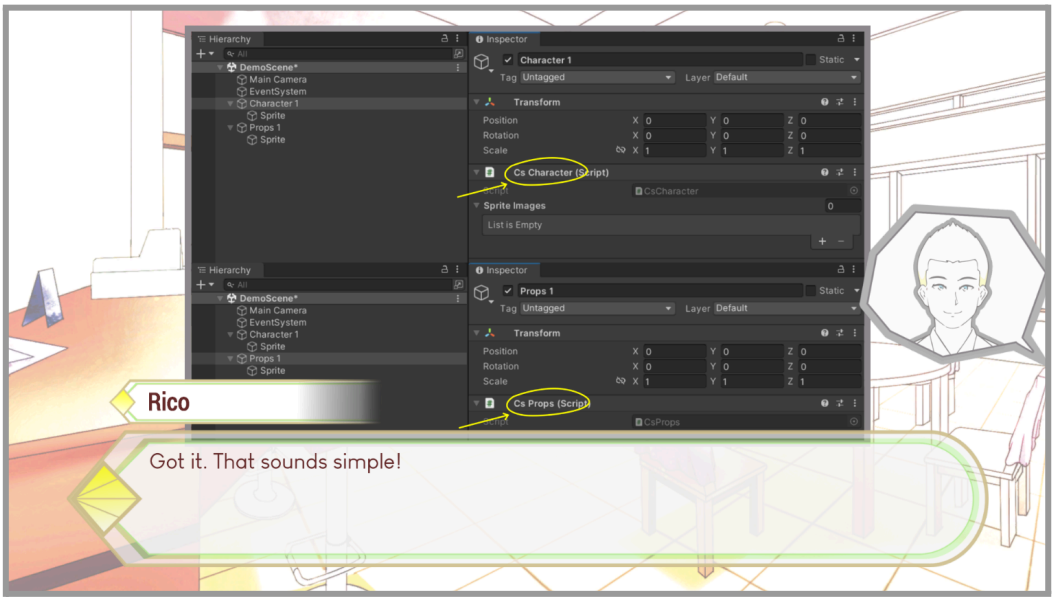
Hisa
It's easy! Just right-click in the Hierarchy, select 'Create Empty', and then add the <sprite renderer> component in the Inspector for the Game Object.



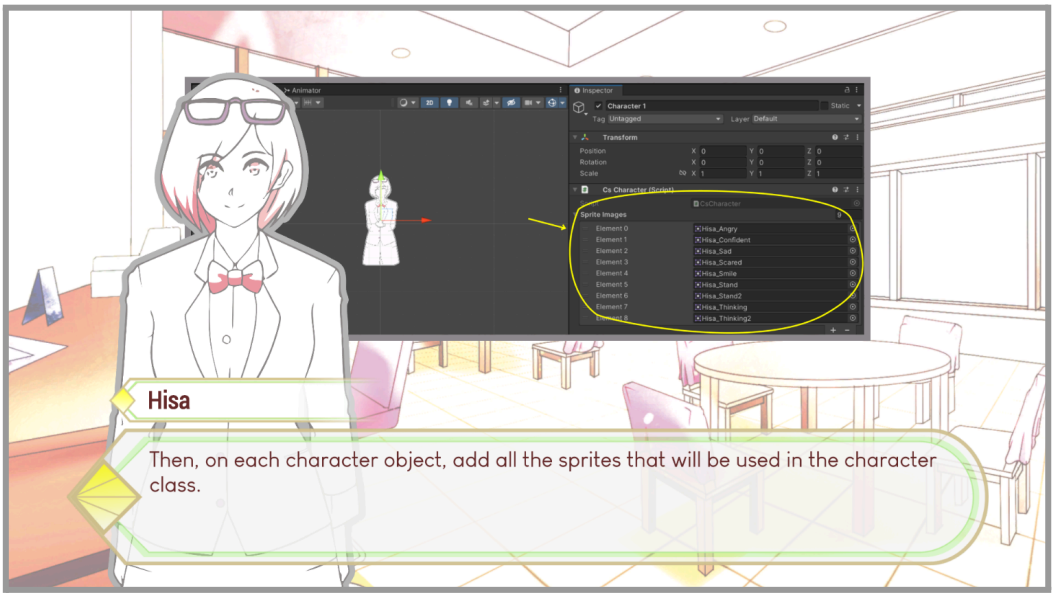
Rico
And what about making them work with Easy Cutscene?



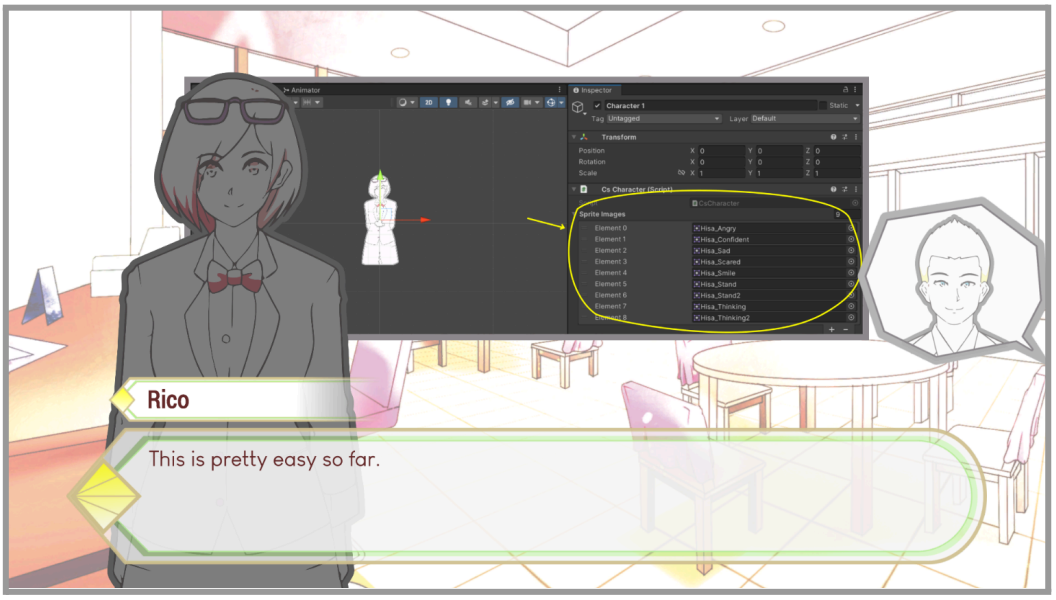
Hisa
Just add the CSCharacter script for characters or CSCharacterProps script for props. This tells Easy Cutscene how to use them.



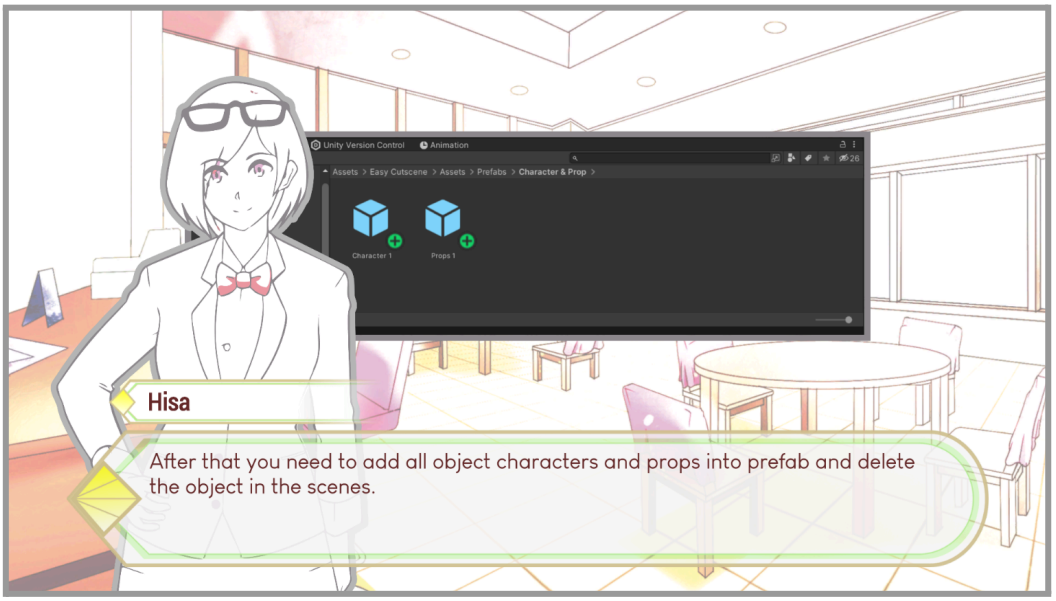
Rico
Got it. That sounds simple!



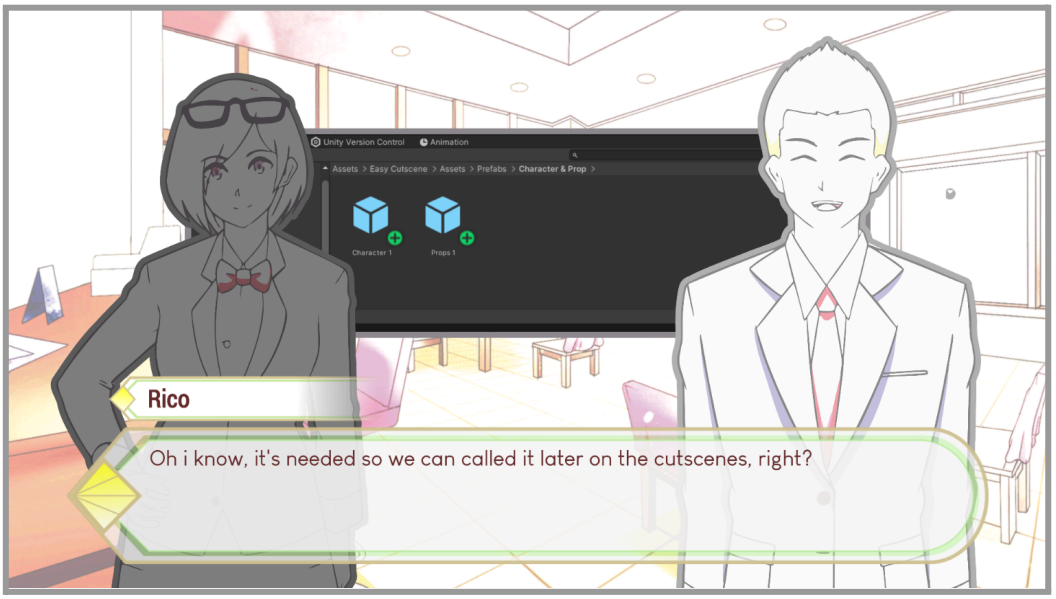
Hisa
Then, on each character object, add all the sprites that will be used in the character class.



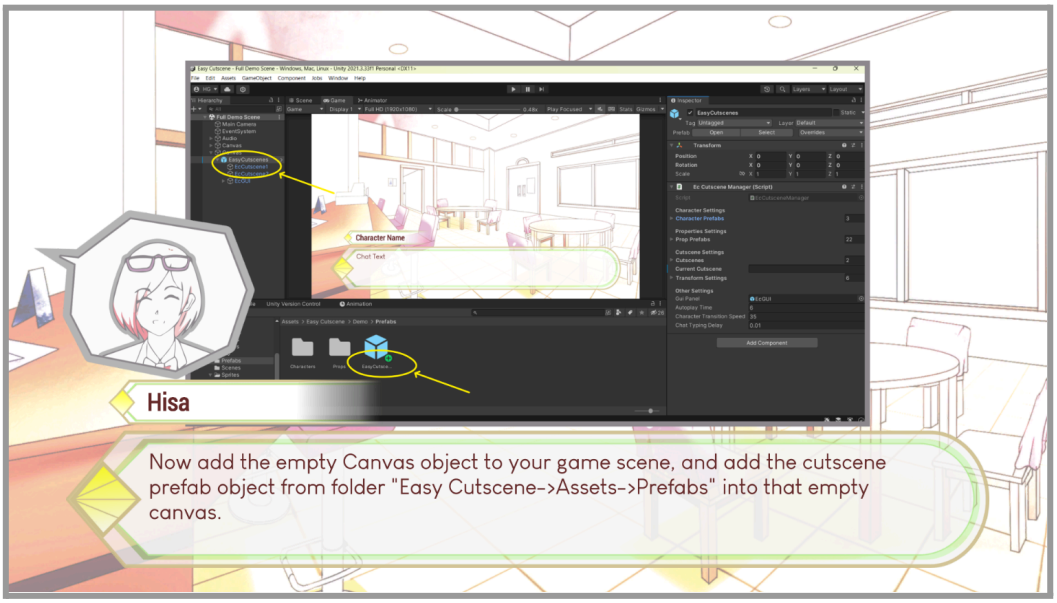
Rico
This is pretty easy so far.



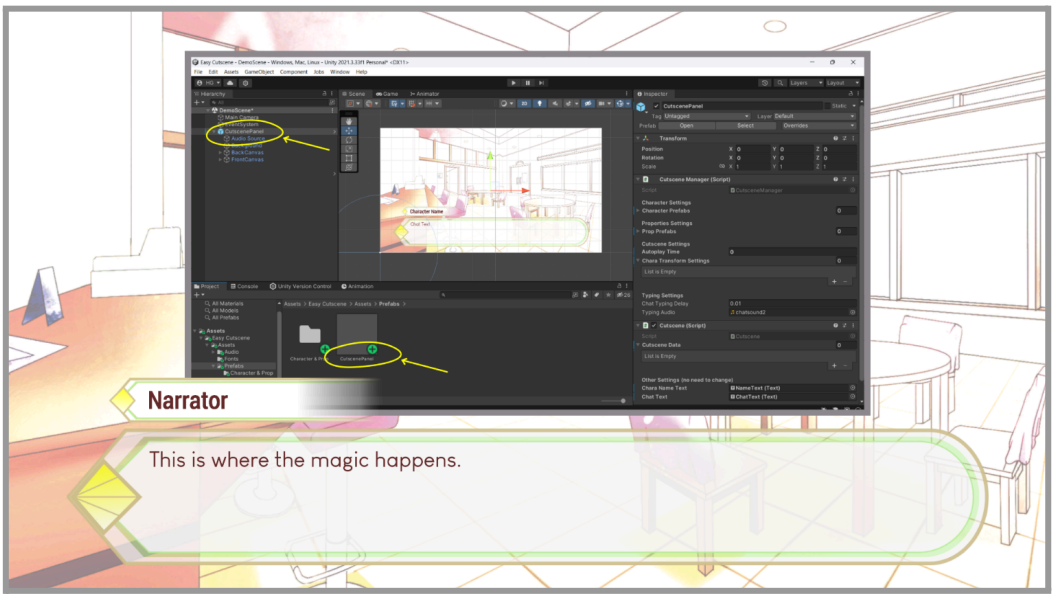
Hisa
After that you need to add all object characters and props into prefab and delete the object in the scenes.



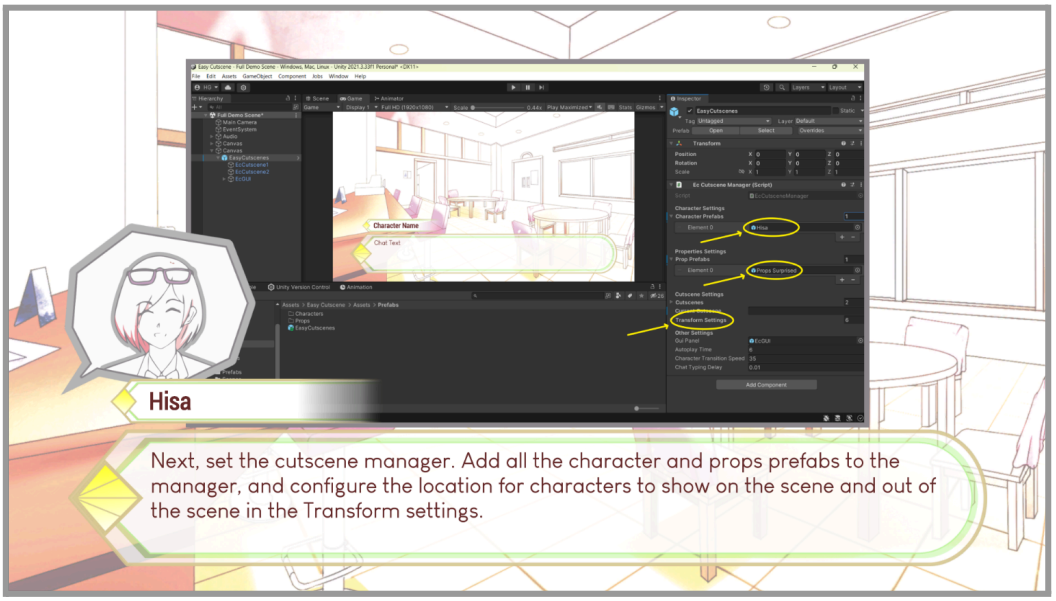
Unity Version Control
Animation
Assets > Easy Cutscene > Assets > Prefabs > Character & Prop
Character 1
Props 1
Rico
Oh i know, it's needed so we can called it later on the cutscenes, right?



Character Name
Chat Text
Hisa
Now add the empty Canvas object to your game scene, and add the cutscene prefab object from folder "Easy Cutscene->Assets->Prefabs" into that empty canvas.

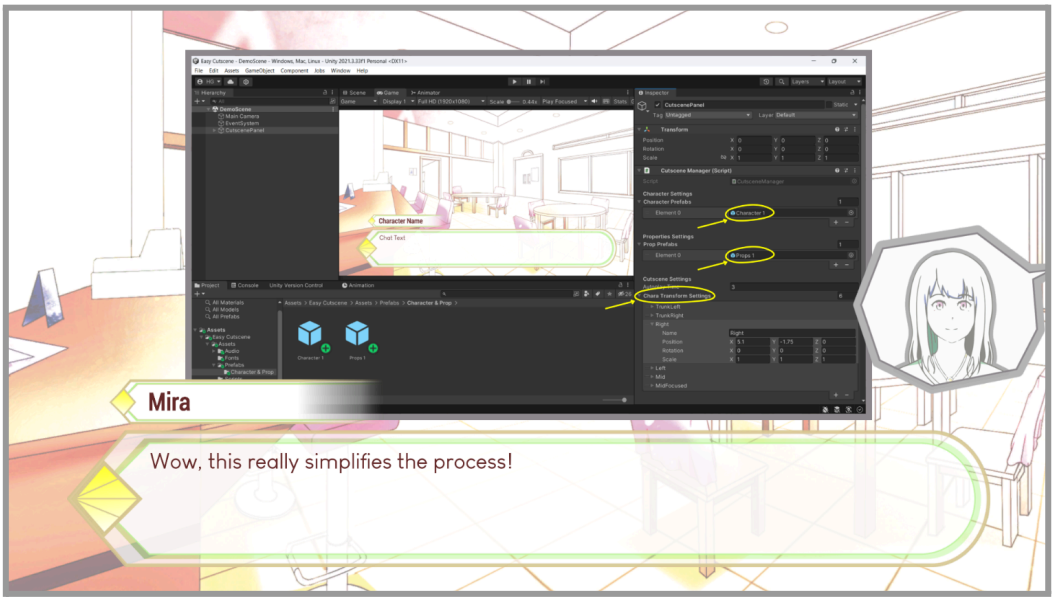


Narrator
This is where the magic happens.



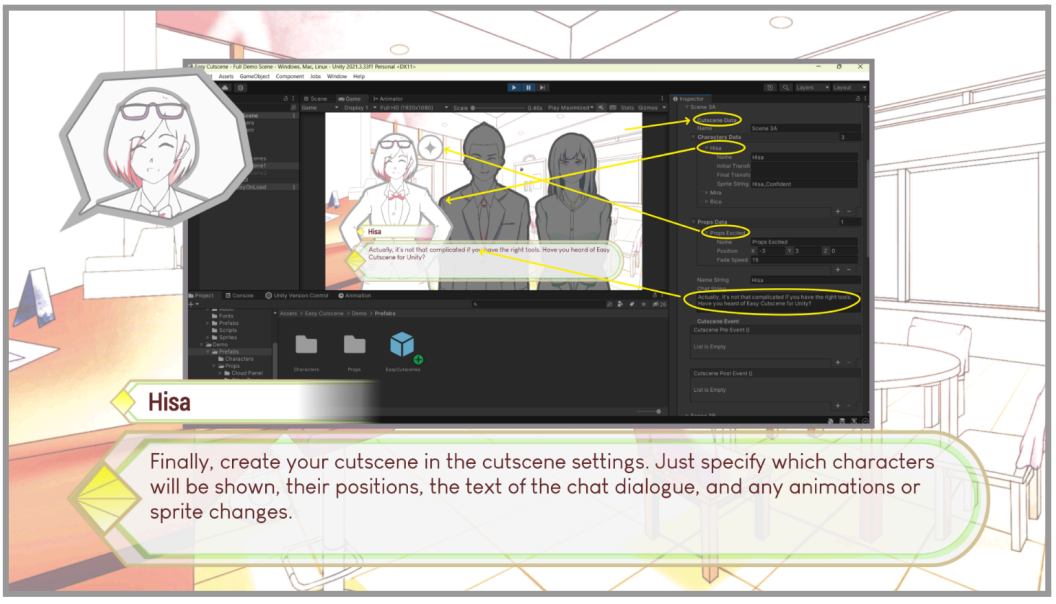
Hisa

Next, set the cutscene manager. Add all the character and props prefabs to the manager, and configure the location for characters to show on the scene and out of the scene in the Transform settings.



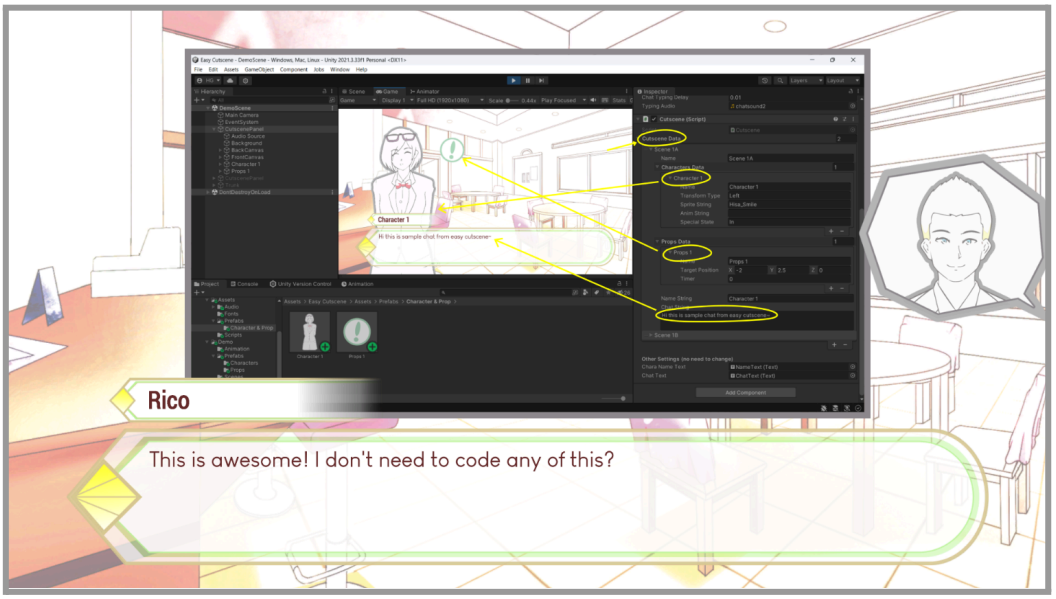
Mira

Wow, this really simplifies the process!

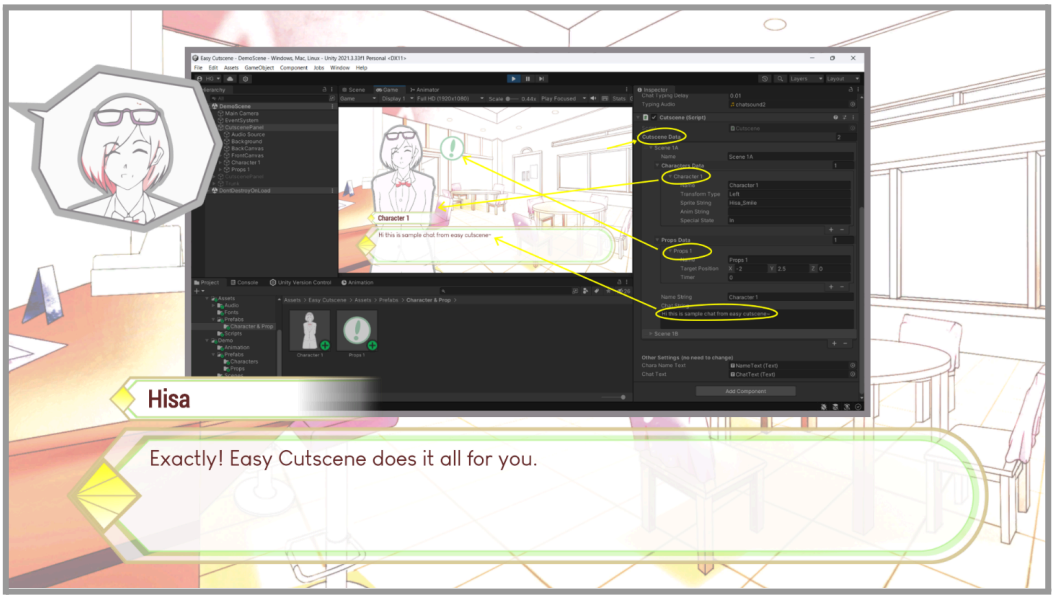


Hisa

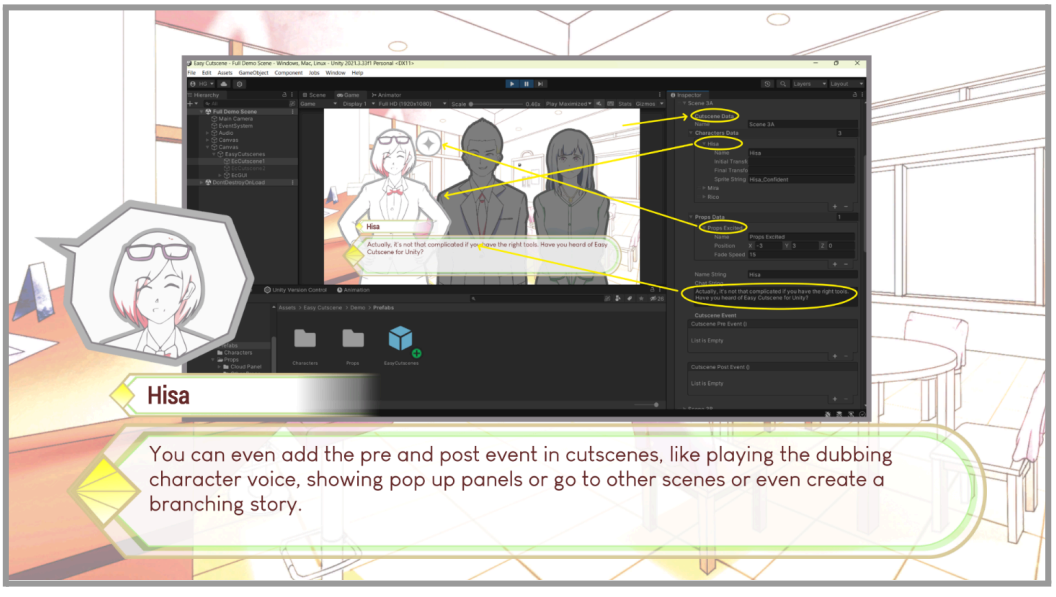
Finally, create your cutscene in the cutscene settings. Just specify which characters will be shown, their positions, the text of the chat dialogue, and any animations or sprite changes.



Rico
This is awesome! I don't need to code any of this?

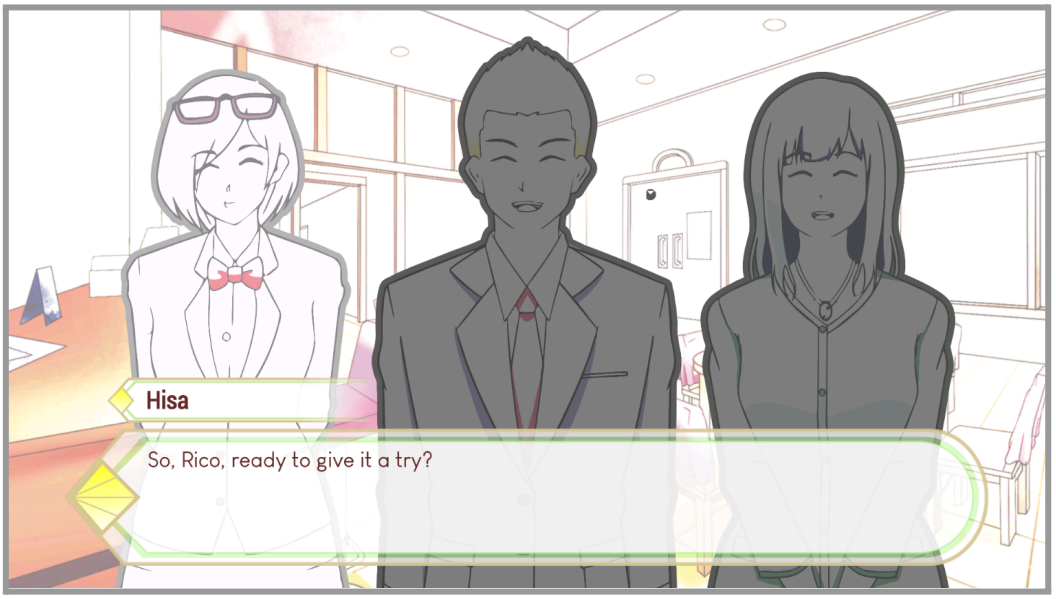


Hisa
Exactly! Easy Cutscene does it all for you.

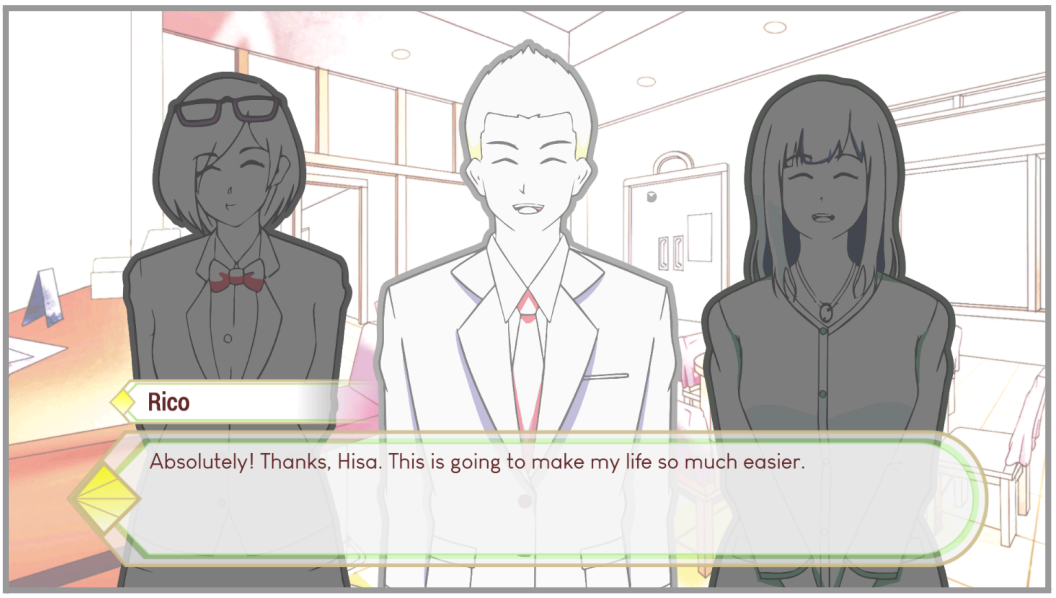


Hisa
You can even add the pre and post event in cutscenes, like playing the dubbing character voice, showing pop up panels or go to other scenes or even create a branching story.

Narrator
And that's it! You've just seen how Easy Cutscene can save you time and effort in creating dynamic cutscenes for your game.



Hisa
So, Rico, ready to give it a try?



Rico
Absolutely! Thanks, Hisa. This is going to make my life so much easier.
